

# DIOSHIELD

Product Features Sheet for

**What is it?** A two-part post-milking product for udder hygiene and conditioning mixed at the point of use.

**How is it used?** Pour equal quantities of Activator (DIOSHIELD A) and Base (DIOSHIELD B) into a clean dip cup and mix until the product is the same colour throughout. Dip each teat after milking to disinfect and condition. DO NOT WIPE.

The mixed solution can be kept for one day. The formulation ensures fast, persistent action with beneficial effect on teat skin.

**What does it do?** Conditions and disinfects to a high standard. Persists on the teats until next milking.

**Do:** Clean the teats by the usual method just before the next milking. Mix a fresh batch every day. This has advantages over products of this chemistry that claim that they can be mixed every seven days (or even more!), which gives a harsh over-strength solution initially which can damage teats and a decreasing strength after 24 hours which will not disinfect adequately. Wash the DIP CUP before every milking.

**Don't:** DO NOT apply either A or B alone. Do not return the mixture to either original container. Do not mix with any other product. Keep out of direct sunlight and keep the lids on containers.

Cover dip cups if product is left in between milkings.

**Pack size:** 20L A and 20L B sold as a pair.
